Step-by-Step Process of the McCabe-Thiele Method

- Plot the equilibrium curve: Obtain data for vapor-liquid equilibrium (VLE) and plot the equilibrium curve on a temperature vs. composition diagram.

- Determine feed and product compositions: Establish the mole fractions of the feed, distillate, and bottom products.

- Draw the operating lines:

- Rectifying operating line (above the feed point) based on reflux ratio and distillate composition.
- Stripping operating line (below the feed point) based on bottom composition and flow rates.

- Construct the staircase diagram:

- Starting from the distillate composition, draw horizontal lines to the equilibrium curve.
- Connect these points with vertical lines along the operating lines.
- Repeat until reaching the bottom composition.

- Count the number of stages:

- Each step in the staircase represents a theoretical stage.
- The total number of steps indicates the number of equilibrium stages needed.

- Determine actual stages:

- Adjust for real column efficiencies if necessary.
