Download the installer from the official PTV Group website or your authorized distributor. Follow the installation wizard, select the desired components, and activate your license.

Exploring the User Interface

Once installed, launch Visum 12 to familiarize yourself with its interface:

- Ribbon Toolbar: Contains the main commands categorized into tabs (File, Network, Demand, Reports, etc.)
- Navigation Pane: Allows access to different modules such as Network, Demand, and Reports
- Workspace/Canvas: The central area where network maps and data are visualized
- Data Browser: Displays detailed data tables for networks, demand, zones, etc.
- Map View: Visual geographic representation of your network

A good initial step is to open a sample project or tutorial dataset to explore the interface components.

Core Components of the Visum 12 Tutorial

The Visum 12 tutorial typically covers several fundamental components:

1. Network Data Preparation

A robust transportation model begins with accurate network data:

- Network Links: Roads, transit routes, bike lanes
- Nodes: Intersections, transit stops
- Zones: Geographic areas representing origins/destinations

Best practices involve importing GIS data or manually building networks within Visum.

2. Creating and Managing Zones

Zones are crucial in demand modeling:

- Define zones based on administrative boundaries or traffic analysis zones (TAZ)
- Assign attributes such as population, employment, or land use
- Use the Zone Editor to create, edit, and validate zones

3. Demand Modeling

Demand modeling estimates travel flows:

- Trip Generation: Estimating trips produced and attracted by zones
- Trip Distribution: Assigning trips between zones

- Mode Choice: Distributing trips across different modes (car, transit, cycling, walking)
- Assignment: Routing trips through the network

The tutorial guides you through setting up these steps using Visum's demand modules.

4. Network Assignment and Calibration

- Assign trips to the network using various algorithms (all-or-nothing, incremental)
- Calibrate the model by adjusting parameters to match observed data
- Use performance measures like volume-to-capacity ratios and travel times

5. Scenario Development and Analysis

Visum enables scenario comparison:

- Create different scenarios (e.g., new transit line, road closure)
- Run simulations for each scenario
- Analyze impacts on traffic, congestion, and accessibility

6. Visualization and Reporting

- Generate maps, charts, and tables
- Export reports for stakeholders
- Use visualization tools for presentations

Deep Dive into Key Workflow Steps

Building the Network Model

To start modeling, you'll need to build a detailed and accurate network:

- Import GIS Data: Use shapefiles, CAD files, or other GIS formats
- Define Network Attributes: Set speed limits, capacities, costs
- Create Transit Networks: Define routes, schedules, stops
- Validate Network Topology: Ensure connectivity and correctness

Demand Estimation Techniques

Demand modeling is central to Visum:

- Utilize external data sources (census, surveys)
- Apply trip generation models based on land use
- Use gravity models for trip distribution
- Incorporate mode choice models using multinomial logit or nested logit models

Assignment Methods

Visum offers various assignment techniques:

- All-or-Nothing Assignment: Simplest, assigns all trips to the shortest path
- Incremental Assignment: Distributes trips over multiple iterations for realism
- User Equilibrium: Balances trip distribution considering congestion

Choose the appropriate method based on the model's purpose.

Model Calibration and Validation

Calibration ensures the model reflects real-world conditions:

- Compare model outputs with observed traffic counts
- Adjust parameters like impedance functions and mode shares
- Use goodness-of-fit measures to assess accuracy

Validation involves testing the model against independent data sets.
