This article delves into a curated collection of objective questions on BJTs, complete with detailed answers, to serve as a valuable resource for exam preparation, self-assessment, or professional reference.

Understanding Bipolar Junction Transistors (BJTs)

Before diving into questions, it's important to establish a foundational understanding of what BJTs are and how they function.

What is a BJT?

A Bipolar Junction Transistor (BJT) is a three-layer, two-junction semiconductor device that amplifies or switches electrical signals. It consists of two types:

- NPN transistor: Comprising a layer of P-type material sandwiched between two N-type layers.
- PNP transistor: Comprising a layer of N-type material sandwiched between two P-type layers.

Operation Principles

BJTs operate primarily through the controlled flow of charge carriers—electrons and holes—across the junctions, which are manipulated via biasing. The three terminals are:

- Emitter (E): Supplies charge carriers.
- Base (B): Controls the transistor's operation.
- Collector (C): Collects charge carriers from the emitter.

The current flow between collector and emitter is controlled by the base current, making BJTs

current-controlled devices.

Answer: b) Emitter, Base, Collector

Explanation:

A BJT has three terminals: the emitter, base, and collector. These terminals are essential for its operation, with the emitter injecting charge carriers, the base controlling current flow, and the collector collecting carriers.

Q2: Which of the following accurately describes the operation of an NPN transistor in active mode?

Answer: c) The base-emitter junction is forward biased, and the collector-base junction is reverse biased.

Explanation:

In active mode, for an NPN transistor, the base-emitter junction is forward biased (allowing current flow into the base), and the collector-base junction is reverse biased, enabling the transistor to amplify signals.

- Current Relationships and Parameters

Q3: If the collector current (I_c) in an NPN transistor is 10 mA and the base current (I_b) is 0.1 mA, what is the current gain (?)?

- a) 10

Answer: b) 100

Explanation:

Current gain (?) is given by:

$$? = I_c / I_b = 10 \text{ mA} / 0.1 \text{ mA} = 100$$

This indicates the transistor amplifies the base current by a factor of 100.

Q4: Which parameter indicates the ratio of collector current to base current?
