physics supplemental problems answer key ch 20

Understanding physics concepts can be challenging, but supplemental problems are an excellent way to deepen your comprehension and prepare for exams. Chapter 20 typically covers advanced topics such as electromagnetism, electromagnetic waves, or modern physics, depending on the curriculum. Having access to a reliable answer key for supplemental problems not only boosts confidence but also ensures you grasp the core principles behind each question. This article provides a comprehensive overview of the key concepts covered in Chapter 20, along with strategies for solving problems and a detailed answer key to help you master the material.

Overview of Chapter 20 Topics in Physics

Chapter 20 often focuses on advanced electromagnetic concepts, including but not limited to:

- Electromagnetic Induction
- Faraday's Law
- Lenz's Law
- Inductance
- Alternating Current (AC) circuits
- Electromagnetic Waves
- The speed of light and wave propagation
- Applications of electromagnetic waves (e.g., radio, radar, optics)

Understanding these core topics is essential for tackling supplemental problems effectively. Below, we'll briefly review each area to set a solid foundation.

Electromagnetic Induction and Faraday's Law

Electromagnetic induction occurs when a changing magnetic flux through a circuit induces an electromotive force (emf). Faraday's Law quantifies this phenomenon:

$$\mathcal{E} = - \frac{d\Phi_B}{dt}$$

where:

- $\mathcal{E}$ is the induced emf,
- Φ_B is the magnetic flux.

Lenz's Law states that the direction of induced current opposes the change causing it, aligning with the negative sign in Faraday's Law.

Inductance and Inductive Reactance

Inductance (L) measures a circuit's ability to oppose changes in current. It is defined as:

$$L = \frac{\Phi_B}{I}$$

where (I) is the current. The induced emf in an inductor is:

$$\mathcal{E}_L = -L \frac{dI}{dt}$$

In AC circuits, inductors introduce reactance:

$$X_L = 2\pi f L$$

which affects the circuit's impedance.

Electromagnetic Waves

Electromagnetic waves are oscillations of electric and magnetic fields propagating through space at the speed of light (c). Key points include:

- The wave nature of light and other EM radiation.
- The relationship between wavelength (λ), frequency (f), and speed:

$$c = \lambda f$$

- The spectrum of electromagnetic radiation, from radio waves to gamma rays.

Strategies for Solving Supplemental Problems in Chapter 20

To efficiently work through supplemental problems, consider the following strategies:

- Identify the Fundamental Concepts

Determine whether the problem involves induction, wave propagation, or circuit behavior.

- Write Down Known Values

List all given quantities, including magnetic flux, magnetic field strength, frequency, inductance, etc.

- Choose the Appropriate Equations

Use relevant laws such as Faraday's Law, inductance formulas, or wave equations.

- Pay Attention to Sign Conventions

Remember Lenz's Law dictates the direction of induced currents and emf.

- Solve Step-by-Step

Break complex problems into smaller parts, solving for intermediate variables.

- Check Units and Magnitudes

Ensure all units are consistent and that the answers are physically reasonable.

Sample Supplemental Problems and Answer Keys

Below are some representative problems from Chapter 20 with detailed solutions and explanations.

Problem 1: Calculating Induced emf in a Moving Conductor

Question:

A straight conductor of length 2 meters moves at a velocity of 3 m/s perpendicular to a magnetic field of 0.5 T. What is the induced emf across the ends of the conductor?

Solution:

Using the motional emf formula:

$$\mathcal{E} = B \times v \times L$$

where:

- $(B = 0.5, \text{ T})$
- $(v = 3, \text{ m/s})$
- $(L = 2, \text{ m})$

Calculating:

$$\mathcal{E} = 0.5 \times 3 \times 2 = 3, \text{ V}$$

Answer:

The induced emf is 3 volts.

Problem 2: Magnetic Flux and Faraday's Law

Question:

A loop of wire with an area of $(0.1, \text{ m}^2)$ is placed in a uniform magnetic field of $(0.2, \text{ T})$. If the magnetic field increases uniformly from 0 to 0.2 T in 4 seconds, what is the magnitude of the induced emf?

Solution:

First, calculate the change in magnetic flux:

$$\Delta \Phi_B = \Phi_{\text{final}} - \Phi_{\text{initial}} = B_{\text{final}} \times A - 0 \times A = 0.2 \times 0.1 = 0.02, \text{ Wb}$$

Since the change occurs over $(\Delta t = 4, \text{ s})$, the induced emf:

$$\mathcal{E} = \left| -\frac{\Delta \Phi_B}{\Delta t} \right| = \frac{0.02}{4} = 0.005, \text{ V}$$

Answer:

The magnitude of the induced emf is 5 millivolts.

Problem 3: Inductance and Energy Stored

Question:

An inductor has an inductance of 0.5 H. If the current through it is 2 A, what is the energy stored in the magnetic field?

Solution:

Using the energy stored in an inductor:

$$U = \frac{1}{2} L I^2$$

Plugging in the values:

$$U = \frac{1}{2} \times 0.5 \times (2)^2 = 0.25 \times 4 = 1 \text{ J}$$

Answer:

The energy stored is 1 joule.

Problem 4: Electromagnetic Wave Speed and Spectrum

Question:

If a radio wave has a wavelength of 300 meters, what is its frequency? Is this within the visible spectrum?

Solution:

Using the wave equation:

$$c = \lambda f$$

Rearranged:

$$f = \frac{c}{\lambda}$$

Where $c = 3 \times 10^8 \text{ m/s}$:

$$f = \frac{3 \times 10^8}{300} = 1 \times 10^6 \text{ Hz}$$

which is 1 MHz.

Since the visible spectrum ranges roughly from (4×10^{14}) Hz to (8×10^{14}) Hz, this frequency is well below the visible range.

Answer:

The frequency is 1 MHz, which is not within the visible spectrum.

Problem Type 1: Magnetic Force on a Moving Charge

Sample Problem:

A proton moves with a velocity of $(3.0 \times 10^6 \text{ m/s})$ perpendicular to a uniform magnetic field of (0.50 T) . Find the magnetic force on the proton.

Answer Key Breakdown:

- Identify known quantities:
 - Charge of proton, $(q = 1.6 \times 10^{-19} \text{ C})$
 - Velocity, $(v = 3.0 \times 10^6 \text{ m/s})$
 - Magnetic field, $(B = 0.50 \text{ T})$
- Recall the magnetic force formula:

$$F = q v B \sin \theta$$

Since the velocity is perpendicular to the magnetic field, $(\sin \theta = 1)$.

- Calculate the force:

$$F = (1.6 \times 10^{-19} \text{ C}) \times (3.0 \times 10^6 \text{ m/s}) \times 0.50 \text{ T}$$

$$F = 2.4 \times 10^{-13} \text{ N}$$

- Conceptual note:

The force is perpendicular to both the velocity and magnetic field, resulting in circular motion.

Educational insight:

The solution demonstrates the direct proportionality of magnetic force to charge, velocity, and magnetic field strength, reinforcing the right-hand rule for force direction.

Problem Type 2: Magnetic Field Due to a Current-Carrying Wire

Sample Problem:

Calculate the magnetic field at a point 0.05 m from a long, straight wire carrying a current of 2.0 A.

$$B = \frac{\mu_0 I}{2\pi r}$$

where $(\mu_0 = 4\pi \times 10^{-7}\text{ T}\cdot\text{m/A})$.

- Calculate the magnetic field:

$$B = \frac{(4\pi \times 10^{-7}) \times 2.0}{2\pi \times 0.05}$$

Simplify numerator and denominator:

$$B = \frac{8\pi \times 10^{-7}}{2\pi \times 0.05}$$

$$B = \frac{8 \times 10^{-7}}{0.05}$$

$$B = 1.6 \times 10^{-5}\text{ T}$$

- Conceptual note:

The magnetic field forms concentric circles around the wire, with magnitude decreasing as distance increases.
